

# Searching for New Physics at the Large Hadron Collider

the discovery of a Higgs particle and beyond

Laura Reina (FSU, Physics Department)

Quarknet at FSU, July 2015

## Very special time for particle physics

Two hadron colliders teamed in the discovery of new physics:

- the **Tevatron** collected high quality data at  $\sqrt{s} = 1.96$  TeV;
- the **Large Hadron Collider (LHC)** very successfully operated at  $\sqrt{s} = 7, 8$  TeV, will reach the designed  $\sqrt{s} = 13 - 14$  TeV starting in 2015, eventually collecting more than 100 times the data of the Tevatron.

Because .....  $E = mc^2$  (!) we do expect to see new particles and to be able to identify them with reasonable accuracy.

# The Standard Model of particle physics

*“The Standard Model is a quantum field theory based on the local symmetry group  $SU(3) \times SU(2) \times U(1)$ .”*

Three Generations of Matter (Fermions)				
	I	II	III

# The Higgs Field and Mass

To understand the Higgs mechanism, imagine that a room full of physicists quietly chattering is like space filled with the Higgs field ...

... a well known physicist walks in, creating a disturbance as he moves across the room and attracting a cluster of admirers with each step ...

... this increases his resistance to movement, in other words ... he acquires mass! ... just like a particle moving through the Higgs field ...

... if now a rumor crosses the room, ...

... it creates the same kind of clustering, but this time among the scientists themselves. In this analogy the Higgs field has materialized and acquired a mass itself!

Light SM Higgs boson strongly favored

Precision measurement provides an invaluable tool to test the consistency of the SM.

$$m_W = 80.385 \pm 0.015 \text{ GeV}$$

$$m_t = 173.2 \pm 0.90 \text{ GeV}$$

↓

$$M_H = 94^{+29}_{-24} \text{ GeV}$$

$$M_H < 152 (171) \text{ GeV}$$

plus exclusion limits (95% c.l.):

$$M_H > 114.4 \text{ GeV (LEP)}$$

Confirmed by direct searches! SM Higgs-like particle discovered at the LHC with  $M_H = 125 - 126$  GeV

plus exclusion limits (95 % c.l.) extended to:

- ▷  $110 \text{ GeV} < M_H < 122.5 \text{ GeV}$  ,  $127 \text{ GeV} < M_H < 600 \text{ GeV}$  (CMS)
- ▷  $111.4 \text{ GeV} < M_H < 122.1 \text{ GeV}$  ,  $129.2 \text{ GeV} < M_H < 541 \text{ GeV}$  (ATLAS)

How can we read these events? How can we tell signal from background?

# Higgs boson production at hadron colliders

$$gg \rightarrow H$$

$$qq \rightarrow qqH$$

$$qq \rightarrow WH, ZH$$

$$q\bar{q}, gg \rightarrow t\bar{t}H, b\bar{b}H$$

# Anatomy of a QCD prediction at hadron colliders

The basic picture of a  $p\bar{p}, pp \rightarrow X$  high energy process ...

where the short and long distance part of the QCD interactions can be factorized and the cross section for  $pp, p\bar{p} \rightarrow X$  can be calculated as:

$$\sigma(pp, p\bar{p} \rightarrow X) = \sum_{ij} \int dx_1 dx_2 f_i^p(x_1) f_j^{p,\bar{p}}(x_2) \hat{\sigma}(ij \rightarrow X)$$

- $ij \rightarrow$  quarks or gluons (partons)
- $f_i^p(x)$ ,  $f_i^{p,\bar{p}}(x)$ : **Parton Distributions Functions**: probability densities (probability of finding parton  $i$  in  $p$  or  $\bar{p}$  with a fraction  $x$  of the original hadron momentum)
- $\hat{\sigma}(ij \rightarrow X)$ : partonic cross section

Theoretical predictions of SM Higgs production have been crucial to discovery: synergy between theory and experiments.

LHC Higgs Cross Sections Working Group

- ▶ highly refined predictions including all known QCD and EW effects on total and differential cross sections available for all production modes;
- ▶ directly used to compare with data at discovery time;
- ▶ now used to study properties of discovered particle and identify it unambiguously.

## Summary: some important facts

- The discovery of a Higgs particle has been an incredible **adventure** that has seen the joint effort of decades of theoretical and experimental work coalesce and give amazing results.
- It has shown the impact of **precise theoretical predictions** when compared with experimental measurements for
  - ▷ discovery of new physics (Higgs boson, Supersymmetry, ...)
  - ▷ precision measurements of masses, coupling ...
- **Further developments** in QCD and EW calculations are **under way** to **face the challenges of Run II of the LHC**, aiming at
  - ▷ testing existing techniques on new problems;
  - ▷ developing new techniques and new algorithms;
  - ▷ understanding the comparison with data.
